

VINOTH

POWER PLATFORM DEVELOPER, 5+

Summary:

5+ years of experience in analysis, design, development, deployment, and support of business applications using Microsoft Power Platform and Microsoft 365

- ☐ Strong expertise in Power Automate for workflow automation, approvals, integrations, custom connectors, and end-to-end business process automation.
- ☐ Proficient in Power BI for developing interactive dashboards, reports, and data visualizations to support data-driven decision-making.
- ☐ Strong knowledge of SharePoint Online, including lists, libraries, permissions, content types, document management, and Power Platform integration.
- ☐ Experience working with REST APIs, Microsoft Graph API, Azure AD App Registrations, JSON, SQL, and Power fx expressions.
- ☐ Good understanding of Power Platform governance, DLP policies, solution management, environment strategies, and CI/CD deployment practices.
- ☐ Familiarity with Azure services such as Azure Functions, Logic Apps, and API Management for advanced integration scenarios.
- ☐ Exposure to SharePoint development technologies including SPFx, ReactJS, TypeScript, PnP Framework, CSOM, Fluent UI, and SharePoint Search.
- ☐ Strong troubleshooting, debugging, and problem-solving skills with experience delivering scalable enterprise solutions and production support.

SKILLS

Power Platform Tools: Power Apps, Power Automate, Power BI, Copilot Studio

☐ **Microsoft 365 &**

Collaboration: SharePoint

Online, SPFx (SharePoint

Framework), Microsoft Teams

Project: Cost Management Portal

Project Description:

The Cost Management Portal is an application built using Power Apps. It integrates several modules to streamline cost management processes, including Purchase Order tracking, Procurement tracking, Resource onboarding, and Resource allocation. Data visualization is provided through Power BI dashboards, with data stored in SharePoint Online.

Modules:

1. PO Tracker: Tracks purchase orders and their associated receipts.
2. Procurement Tracker: Users fill in required details and license expiry dates. A reminder field is set, and Power Automate flows are triggered automatically based on the reminder date to send expiry alerts via email.
3. Resource Onboarding: Facilitates the onboarding process by allowing users to fill out necessary information and submit the forms.
4. Resource Allocation: Allocates onboarded resources to projects, calculating daily costs based on allocation percentage, and determining whether the resource is a full-time employee (FTE) or a subcontractor (Subcon).
5. Power BI Dashboard: Visualizes data from the portal in charts and tables, allowing users to filter data and download tables in CSV format.

Responsibilities:

Worked on Power Apps canvas apps to develop and implement various modules of the Cost Management Portal.

- Created and optimized workflows using Power Automate to automate key processes, such as sending reminder emails based on license expiry dates.
- Designed and maintained Power BI dashboards to visualize data from the portal, providing actionable insights and enabling data-driven decision-making.
- Customized SharePoint Online for data integration and storage, ensuring seamless data management and accessibility across the modules.
- Conducted regular demonstrations to clients, showcasing developments and functionalities of the Cost Management Portal, and gathering feedback for continuous improvement.

**Project: BUPA Connect****Project Description:**

BUPA Connect is an application built as part of a migration project aimed at transitioning from an on-premises solution to a cloud-based platform using Power Platform. Initially developed using .NET code, the application maintains its original UI while shifting from SharePoint On-Premises to SharePoint Online. During this process, existing APIs were replaced with Apigee APIs integrated through Power Automate. The solution includes various API flows, such as search, GET, and upload, which interact with SharePoint Online. Logging for API flows is managed, capturing errors in Dataverse tables. Additionally, a Power Apps canvas app was created to facilitate post-production support by displaying logs with filters.

Responsibilities:

Worked on Power Apps canvas apps to develop and implement various functionalities within BUPA Connect.

- Created and optimized workflows using Power Automate to integrate Apigee APIs, ensuring seamless data retrieval and updates with SharePoint Online.
- Customized SharePoint Online for data integration and storage, ensuring a smooth transition from SharePoint On-Premises.
- Maintained logs for API flows, capturing errors in Dataverse tables to support troubleshooting.
- Developed a Power Apps canvas app to display logs with filters, aiding post-production support teams in identifying and resolving issues efficiently
