

SANCHIT

HR AI AGENT BUILDER, 8+

Summary:

- AI Workflow Architect and Full Stack Engineer with 8+ years of backend engineering experience and deep specialisation in agentic AI systems — designing autonomous agents that reason, orchestrate, and act across integrated enterprise platforms.
 - Proficient in LangGraph, LangChain, CrewAI, MCP (Model Context Protocol), OpenAI APIs, and Claude/Anthropic Agent SDK for building multi-step, tool-using, human-in-the-loop agentic workflows.
 - Experienced in n8n, Zapier-equivalent automation, and code-based orchestration for automating complex multi-system workflows including data enrichment, decision triggers, and automated write-backs to enterprise systems.
 - Strong foundation in RAG (Retrieval-Augmented Generation), vector databases (ChromaDB, Pinecone), knowledge base construction, and prompt engineering to prevent hallucinations and enforce policy-aligned outputs.
 - Built AI systems that automate candidate qualification, data enrichment pipelines, scoring engines, and lifecycle-triggered automation — capabilities directly applicable to recruiting operations, employee lifecycle management, and talent intelligence.
 - Backend engineering expertise in Python (FastAPI, Django, Flask), REST APIs, PostgreSQL, MongoDB, and AWS — enabling deep integration with Workday HRIS, ATS platforms, and HR tech stacks via API and webhook layers.
 - Experienced building and deploying production agentic applications with guardrails, evaluation frameworks, tool-use constraints, and human-in-the-loop review protocols for enterprise-scale reliability.
 - Comfortable with JSON, APIs, webhooks, organisational data hierarchies, skills taxonomies, and knowledge base management — core requirements for HR data-driven agentic systems.
-

SKILLS

Agentic AI

Frameworks: LangGraph, LangChain, CrewAI, MCP (Model Context Protocol), Claude Agent SDK, OpenAI APIs, Custom Agent Frameworks

Automation Platforms:

n8n, code-based orchestration, webhook automation, event-driven

PROJECTS

MailMind – Autonomous Email Intelligence Agent

Description: Production-grade agentic email management system (~3,200 lines, 22 files) that autonomously reads, classifies, prioritises, and responds to emails using LangGraph multi-agent orchestration. Directly demonstrates the autonomous workflow capability required for HR agent pipelines.

Technologies: Python, FastAPI, LangGraph, LangChain, Anthropic Claude API, ChromaDB, MCP Servers, Celery, Redis, RAG

Role / Team: Lead AI Engineer / Architect Team: Solo

Key Contributions:

- Architected a multi-agent LangGraph system with stateful agent graphs — each agent node handling a distinct reasoning task (classify, retrieve context, draft, review, send) with conditional branching and human-in-the-loop approval gates.

pipelines, Zapier-equivalent flows

RAG & Vector Search:

RAG pipeline design, ChromaDB, Pinecone, vector embeddings, knowledge base construction, semantic search

Prompt Engineering:

Reasoning loop design, hallucination prevention, structured output enforcement, policy-aligned prompts, HITL protocols

Backend & APIs: Python

(FastAPI, Django, Flask), REST API design, WebSocket, OAuth2, OpenAPI/Swagger, Java/Spring Boot

Databases: PostgreSQL,

MongoDB, MySQL — schema design, query optimisation, employee/organisational data modelling

Cloud & DevOps: AWS

(Lambda, SQS, ECS, S3, API Gateway), Docker, CI/CD, Git | AWS Certified Developer

HR Tech (Exposure):

Workday HRIS API patterns, ATS webhook integration, REST-based HRIS connectors, employee data hierarchy modelling

- Built RAG pipeline using ChromaDB for policy-aware email context retrieval — directly analogous to an HR agent retrieving company HR policies before responding to employee queries.
- Implemented MCP (Model Context Protocol) server integration enabling agents to invoke external tools (calendar, CRM, database lookups) — the same pattern used to connect HR agents to Workday HRIS, ATS, or engagement platforms.
- Designed hallucination-prevention prompting with structured output validation, output schema enforcement, and fallback retry logic ensuring reliable, policy-compliant agent outputs.
- Built Celery + Redis async task queues for background agent job processing, enabling the system to handle concurrent email streams without blocking — applicable to concurrent HR event processing (onboarding triggers, lifecycle events).
- Wrote 25-question interview Q&A suite and full file-by-file delivery documentation demonstrating deep understanding of every architectural decision.

Cloudwords – AI-Powered Vendor Qualification & Scoring Engine

Description: Enterprise localisation platform where an AI scoring engine autonomously qualifies, ranks, and recommends vendors for each project — structurally identical to an AI agent qualifying and ranking candidates for open roles in a recruiting pipeline.

Technologies: Python, Flask, LangChain (scoring logic), REST APIs, MySQL, RAG-ready data layer, n8n-compatible webhooks

Role / Team: AI Workflow / Backend Engineer | Team: 20+

Key Contributions:

- Built autonomous multi-criteria scoring engine that ingests vendor profiles, evaluates them against project requirements, and outputs ranked recommendations — directly analogous to AI-driven candidate qualification from resumes and skills data.
- Designed webhook-compatible REST API layer enabling real-time bid events to trigger automated re-ranking workflows — the same event-driven pattern used for ATS webhook → agent trigger → candidate status update flows.
- Implemented configurable rule overlays allowing HR-style policy constraints (e.g. preferred vendor tiers, DEI weighting, budget caps) to be enforced by the scoring engine without model retraining.
- Built n8n-compatible integration endpoints enabling no-code automation teams to orchestrate the scoring engine within broader workflow automation pipelines.

COPS – Autonomous Network Alert & Recommendation Agent

Description: Real-time agentic monitoring system that ingests live telemetry, evaluates rules, predicts degradation, and autonomously generates prioritised recommendations for

operator action. The agent architecture — continuous monitoring, state evaluation, reasoning, action — mirrors an HR agent monitoring employee lifecycle events and triggering personalised workflows.

Technologies: Python, Java, Spring Boot, LangGraph-equivalent state machine, PostgreSQL, WebSocket, REST APIs, OAuth2, Docker

Role / Team: Senior AI / Backend Engineer | Team: 25+

Key Contributions:

- Designed stateful event-monitoring agent that continuously ingested live data streams, evaluated multi-variable rule conditions, and autonomously triggered downstream action workflows — the exact pattern for HR lifecycle event monitoring (onboarding triggers, promotion detection, attrition risk alerts).
- Built probabilistic reasoning layer modelling multiple network degradation scenarios to generate ranked, explainable recommendations for operators — analogous to workforce planning agents forecasting attrition risk and surfacing succession recommendations.
- Implemented human-in-the-loop review gates for high-severity recommendations, ensuring critical autonomous outputs were reviewed before system execution — the governance pattern required for HR AI agents.
- Architected microservice deployment enabling individual agent components (ingestion, evaluation, recommendation, notification) to be updated independently — the modular design pattern for scalable HR agent stacks.
- Built audit trail capturing every agent decision, reasoning path, and action taken — directly applicable to HR compliance and DEI audit requirements.

CMS Global – RAG-Powered Policy & Data Intelligence Platform

Description: Government data platform with a rule-based query and report generation layer — RAG-style architecture connecting analyst questions to large structured datasets, producing policy-compliant intelligence reports. Analogous to an HR knowledge-base agent retrieving and synthesising policy information for employee queries.

Technologies: Python, Django REST Framework, RAG architecture, MySQL, SQL Server, REST APIs, audit trail, CI/CD

Role / Team: AI / Backend Engineer | Team: 10+

Key Contributions:

- Built retrieval layer connecting natural-language rule queries to large government datasets — structurally equivalent to a RAG pipeline retrieving HR policy documents to answer employee questions accurately.
- Implemented full audit trail for every data query, rule evaluation, and report generation — all agent decisions logged with user identity, timestamp, and reasoning context for compliance review.

- Designed policy-enforcement layer ensuring generated reports adhered to predefined output schemas and compliance rules — the same guardrail pattern needed for HR AI agents producing DEI-compliant, legally aligned outputs.
- Built REST API layer with OpenAPI documentation enabling integration with external tools and third-party platforms — directly applicable to Workday API and ATS platform connectivity.

Link Financial – Event-Driven Autonomous Routing Agent

Description: Fintech platform with an autonomous payment routing agent that evaluates transaction attributes, selects optimal gateway paths via rule-based logic, and executes routing decisions — demonstrating production-grade autonomous decision-making at scale.

Technologies: Python, FastAPI, Spring Batch, AWS SQS, MySQL, Docker, CI/CD, REST APIs

Role / Team: AI / Backend Engineer | Team: 10

Key Contributions:

- Built autonomous routing decision engine evaluating multi-variable transaction attributes and executing gateway selection without human intervention — production-proven autonomous decision pattern applicable to HR workflow routing (route onboarding request to correct HR team, benefit system, or manager).
- Designed SQS-backed event pipeline for async autonomous processing — the same architecture used to trigger HR agents from HRIS system events (new hire created, status changed, review cycle opened).
- Implemented batch scoring pipeline for processing large transaction volumes — analogous to bulk candidate pipeline scoring in recruiting operations.
- Built comprehensive automated test suite and CI/CD pipeline with deployment gates — ensuring reliable, auditable autonomous system behaviour in production.
