

SAIRAM

FRONTEND DEVELOPER, 5+

Summary:

Frontend Developer with 5+ years of experience building scalable, high-performance Single Page Applications (SPAs) for enterprise clients across healthcare, logistics, e-commerce, insurance, and public safety domains. Proficient in React.js, Redux Toolkit, TypeScript, and modern JavaScript (ES6+), with a strong track record of improving performance by up to 40%, reducing defects by 25%, and accelerating feature delivery. Experienced in JWT authentication, REST/GraphQL API integrations, WebSocket, CI/CD pipelines, Jest/React Testing Library, and Agile/Scrum delivery.

SKILLS

Frontend

Technologies: React.js, Next.js (App Router), TypeScript, JavaScript (ES6+), HTML5, CSS3.

State Management:

Redux Toolkit, Context API, useReducer.

API integration &

Auth: REST APIs, GraphQL, Apollo Client, Axios, Fetch, JWT, Token Refresh Strategy, Session Management

Performance

optimization: Code Splitting, Lazy Loading, React.memo, useMemo, useCallback, Virtualization libraries.

UI Libraries: Material UI, Ant Design, Styled Components, Tailwind CSS.

PROJECTS

Project 1. UPS HealthCare — Healthcare Logistics Platform

- Built scalable SPAs for real-time healthcare logistics tracking using React.js and Edge Delivery Services (EDS), reducing frontend load time by ~30% through lazy loading and optimized asset delivery.
- Designed and implemented reusable React component library (forms, tables, modals, status indicators) used across 10+ modules, cutting new feature development time significantly.
- Integrated GraphQL queries and mutations with Apollo Client for dynamic shipment and patient data fetching, replacing REST endpoints for complex nested data needs.
- Implemented JWT-based authentication with silent token refresh using Axios interceptors, protecting all private routes and maintaining seamless user sessions.
- Used React Context API and useReducer to manage complex multi-step workflow states (order creation, tracking, delivery confirmation) without prop drilling.

Project: 2. Victoria's Secret — E-Commerce Platform

- Integrated product catalog, inventory, and pricing REST APIs using Axios with request caching and debounced search to minimize redundant network calls on the storefront.
- Applied React.lazy and Suspense for route-level code splitting across the checkout funnel, reducing initial bundle size and improving time-to-interactive on mobile devices.
- Built responsive, pixel-perfect UI components from Figma designs using Styled Components, ensuring consistent brand rendering across breakpoints (mobile, tablet, desktop).

Real-time

communication:

WebSocket, Socket.io.

Testing:

Jest, React

Testing Library.

Code Quality:

ESLint.

Build & dev tools:

Webpack, Vite, npm, Git,

GitHub Actions, CI/CD

Pipelines

Accessibility:

Semantic

HTML, ARIA Roles.

Tools & collaboration:

GitHub, Jira, Figma, VS

Code, Agile/Scrum

AI & Productivity

Tools: GitHub Copilot,

ChatGPT, Vercel, Claude

AI (Code Refactoring &

Optimization)

EDUCATION

Bachelor of Computer

Science from Vikrama

Simhapuri University,

2019 | 70%

Project: 3. H&M — Retail E-Commerce Platform

- Architected a scalable component system for H&M's multi-region storefront using React.js and EDS, enabling rapid deployment of localized content across 5+ regional markets.
- Integrated error boundaries and fallback UI components to gracefully handle API failures and network errors, improving platform reliability for high-traffic sale events.
- Optimized re-render performance using React.memo and useMemo on heavy list components, reducing unnecessary renders by ~40% during rapid user interactions like filtering and sorting.

Project 4. Safety Management — Public Safety Platform

- Architected modular React.js components with Redux Toolkit for predictable global state management, handling complex real-time incident data across a high-stakes public safety dashboard.
- Reduced UI production defects by ~25% by introducing component-level unit tests using Jest and React Testing Library, catching regressions before they reached production.
- Accelerated feature delivery by 20% by building a shared internal component library (buttons, forms, data tables, alerts) adopted across all product modules.

Project 5. TATA AIG Insurance — Insurance Portal

- Built a secure insurance policy management portal using React.js with JWT authentication, protected routes, and silent token refresh via Axios interceptors for uninterrupted session handling.
- Integrated RESTful APIs for policy retrieval, premium calculation, and claim submission with centralized error handling and loading state management using custom hooks.
- Leveraged React.lazy and Suspense for code splitting across heavy portal sections (policy dashboard, claims history), reducing initial bundle load time noticeably.
- Managed complex local and global state using a combination of Redux for shared data and useState/useReducer for component-level form and UI states.

Project 6. HealthClaim — Healthcare Domain

- Developed responsive UI modules for a healthcare claims processing platform using HTML5, CSS3, and React.js, translating wireframes into functional, production-ready components.

- Utilized ES6+ JavaScript patterns including async/await, Promise chaining, destructuring, and optional chaining to write clean, readable, and maintainable component logic.
- Implemented conditional rendering and loading skeletons to improve perceived performance during API calls, reducing user frustration on slower network connections.

Freelance React.js Developer | Self-Employed

- Developed and delivered scalable React.js, Next.js, and TypeScript web applications for clients across healthcare, e-commerce, and business service domains, focusing on reusable component architecture and responsive UI development.
- Integrated REST APIs using Axios and custom hooks, implementing structured error handling, loading state management, and optimized asynchronous data fetching for improved application reliability.
- Collaborated directly with clients to gather requirements, translate business needs into technical solutions, and deliver production-ready features within defined timelines.

Key Achievements:

- UPS Healthcare — Reduced initial page load from 4.2s → 2.5s via route-based lazy loading, code-splitting, and Vite bundle optimization.
- H&M — Cut long tasks from 180ms → under 16ms using React.memo and useMemo, achieving smooth 60 FPS scroll performance on high-traffic product listings.
- Box Ventures -Reduced production UI bugs and improved code quality by building automated unit and integration test pipelines with Jest and React Testing Library.
